

## Homework 2 - Due date: 27.11.2020

1. Create a **Spring Boot Application** for the chosen project. The application should have the same name as the project.
2. Create your **domain objects** (similar to Lab 5). This is possible to change during the project implementation. For this homework you should create only the objects that result from your project description.
3. Create the beans for defining **repositories**. One repository per entity. Add the beans to the Spring context in order to be injected in services later. For this homework use an In memory database (it can be a list - similar to Lab 5).
4. Create the **service** for your first feature defined. Make this service also a bean and add it to the Spring Context. Inject the repository bean needed into this bean. Implement the functionality described in the first homework.
